# Measuring air quality in Matei Bals

EXCELLENCE IN PANDEMIC RESPONSE AND ENTERPRISE SOLUTIONS

A case study in an infection hospital in Romania

Ville Silvonen, Tampere University Contact: ville.silvonen@tuni.fi

E3 Seminar: Tackling pandemics in Helsinki 16.5.2023

www.pandemicresponse.fi

# Objectives

- Can the risk of infection in a naturally ventilated building be lowered using air purification units?
- Studying existing indoor air quality and ventilation status in the hospital
- Installing air purification units in the studied spaces
- Measuring the effect of this intervention on air quality
- Also: gathering supporting data for simulations and risk models
  - Verifying simulation results experimentally

# Risky spaces investigated in Matei Bals

Waiting area ICU room Covid room

# Waiting area

• Located in the main hospital building on the first floor

## Waiting area

Measurement instrument

• Air purifier unit

Waiting area

### ICU unit

• Located in the main hospital building on the Second Floor

#### ICU room

### Covid Ward

• Located in the Covid ward building on the Second Floor

#### Covid Ward

• Measurement instrument

• Air purifier unit

## Parameters investigated

- Temperature (T) (indoor and outdoor)
- Relative Humidity (RH) (indoor and outdoor)
- Carbon Dioxide (CO2).
- Particulate Matter (PM10, PM2.5, PM1.0) (indoor and outdoor)
- Total Volatile Organic Compounds (TVOC).
- Lung deposited surface area (LDSA) (Indoor and outdoor)
- Black carbon (BC) pollution (indoor and outdoor)
- Microbiological sampling.
- Airflow rates.
- Air and surface temperature.

#### Observair- black carbon mass concentration

## Parameters investigated outdoors

Mounted to a wall in the balcony – 2<sup>nd</sup> floor – covid section

## Preliminary results

I/O-ratio in the waiting area before and after installing the air purifier. Results are preliminary.

Preliminary results

I/O-ratio in the ICU room before and after installing the air purifier. Results are preliminary.

I/O-ratio in the Covid room before and after installing the air purifier. Results are preliminary.

# Conclusions

- Air purifiers were efficient in reducing airborne particulate matter in the naturally ventilated hospital
- Measurements are in a key role when we search for methods to tackle pandemics
  - Learning to know the aerosol means we can develop ways to identify certain parts of it
- We can verify and compare data with simulations, bringing us towards a more complete understanding
